

Introducing International Advanced Technologies, Products, and Service Concepts.

More than 40 years ago, Deng Xiaoping, the great architect of China's reform and opening-up, opened the national doors wide to allow state-owned enterprises, private enterprises, China enterprises and foreign enterprises to participate in the market competition fairly, which released great creative vitality for the market economy.

As for foreign enterprises, as long as they put international capital, advanced technology, advanced products or advanced service concepts into China, the China Government has provided land free of charge and reduced taxes for several years. Foreign enterprises competed to settle in China.

At that time, in China and even in academic circles, there was a great incomprehension about the "Treatment Beyond National Standards" obtained by foreign enterprises, and there were even different voices.

After foreign capital and advanced technology poured into China, on the one hand, foreign enterprises earned money, on the other hand, China's economy and GDP developed rapidly. On the one hand, it solved the local employment in China; on the other hand, enterprises in China and people in China learned the most advanced technology products and service concepts in the world. China local enterprises and technical engineers are learning and growing. After ten, twenty and thirty years, China's local enterprises, industries, technologies and products have gradually matured in the introduction of competition

The reality is that the most of Chinese advanced technology and products with good quality and low price in the world in China today have covered the local market in China, and a large number of Chinese technology and Chinese products with good quality and low price are serving Asia, the Middle East, Africa, South America and even North America.
